

Problem - Solution Fit

Date: 11 June 2026

Project Name: E-commerce Application

Problem – Solution Fit

1. Customer Segment

- **Target Audience:** Internet users looking to purchase products online easily and securely.
- **Secondary Audience:** Store owners/administrators who need to manage inventory and view sales analytics.

2. Customer Problem

- Shoppers experience cart loss across devices, poor search filtering, and lack of trusted payment gateways.
- Store owners lack a centralized, easy-to-use dashboard to track orders, revenues, and manage product listings.

3. Existing Alternatives

- **Alternative 1:** Shopify (can be expensive, restrictive for custom features).
- **Alternative 2:** WooCommerce (requires WordPress overhead, plugin management).
- **Alternative 3:** Custom PHP scripts (often lack modern single-page-app feel and performance).

4. Proposed Solution (The E-commerce App)

- **MERN Stack:** Provides a seamless, fast, Single Page Application (SPA) experience using React.
- **Persistent Cart & Auth:** JWT and MongoDB ensure the user's cart is saved across devices securely.
- **Advanced Features:** Full-text search, dynamic filtering (price, rating, category).
- **Admin Dashboard:** Dedicated portal for admins to manage stock, update orders, upload images via Cloudinary, and view sales metrics.
- **Payment Gateways:** Integration with a Payment Gateway to build trust and simplify checkout.
